in Prague, Prague, Czech Republic*

---

## Abstract

This paper provides a complete classification of all t-norms on a family of lattices in terms of t-norms on discrete chains. Moreover, the cardinal of some classes on discrete chains is computed. Therefore, the number of t-norms on the family of lattices is obtained. Also, new results involving Archimedean and divisible t-norms are presented. Finally, we bring out dual results for t-conorms.

*Keywords:* T-norm, t-conorm, lattice, Archimedean, divisible, 1-Lipschitz.

---

## 1. Introduction

T-norms and t-conorms are basic tools in the framework of Fuzzy Logic. They extend the conjunction and disjunction of classical sets and are suitable to define fuzzy algebraic structures (for instance, see [1, 32]).

5 Firstly, they were defined on the interval  $[0, 1]$ , but the need to work with incomparable elements is required in many contexts, so a more general algebraic structure is fundamental (see [19]). Consequently, they have been studied on bounded lattices (for instance, see [13, 15]).

One object of interest is to find which operators defined on bounded lattices  
10 are t-norms (or t-conorms), or at least to estimate the number of them. If the bounded lattice is not finite, the number of them is infinite. Also, finite lattices are used in the practice. For these reasons, we have focused on a family of finite lattices in the paper.

A pioneering article in this context was written by De Baets and Mesiar in  
15 1999. They provided the number of t-norms on discrete chains up to a length  
of fourteen by computational methods (see [12]). Also, Bartušek and Navara  
studied conjunctions on finite chains using a computer program generating all  
t-norms (see [4]), and Petřík focused on the building of finite negative totally  
ordered monoids, in particular, discrete t-norms (see [30, 31]). Recently, the  
20 number of t-norms on other families of lattices is found in [5].

In general, the study of obtaining t-norms and t-conorms on bounded lat-  
tices is a current topic (for instance, see [3, 10, 17]). There are different lines  
of research focused on obtaining and building new t-norms. In 2005, Zhang  
provided a method to obtain t-norms through monotone functions on bounded  
25 partially ordered sets (see [38]). In particular, his work can be applied to finite  
lattices. In the studies of Palmeira et al., methods and techniques are presented  
to extend t-norms (and t-conorms) from sublattices to lattices that contain them  
(see [28, 29]).

Another way to obtain new t-norms from ones already given is through the  
30 ordinal sum. However, the ordinal sum of t-norms on a finite lattice does not  
have to be a t-norm. In 2008, Saminger et al. studied the ordinal sum of t-  
norms and the horizontal sum of bounded lattices (see [35]). In 2012, Medina  
determined several necessary and sufficient conditions so that the ordinal sum  
of two t-norms is also a t-norm (see [26]). In 2018, it is provided a method to  
35 construct ordinal sums of t-norms (and t-conorms) on any bounded lattice (see  
[9]). Recently, new constructions of ordinal sums of t-norms (and t-conorms)  
on bounded lattices have been presented (see [11, 14, 16]).

It is worth noting that t-norms and t-conorms are not the only operators that  
are being investigated. Uninorms were recently defined on bounded lattices (see  
40 [22]) and characterized by means of t-norms and t-conorms (see [8, 21]). More  
generally, aggregation functions and t-operators can be defined on bounded  
lattices (see [7, 23]). All these operations are generalizations of the two concepts  
that we study in-depth in this paper: the t-norm and the t-conorm.

In this article, we describe each and every one of the t-norms defined on a

45 family of finite lattices in terms of the t-norms defined on the discrete chains.  
Some of them can be obtained using the ordinal sum, but most are not. The  
lattices (see Figure 1) resemble the horizontal sum of discrete chains (see [33]).  
Our family of lattices has the same elements as a horizontal sum of discrete  
chains, but the imposition of a new connection between two elements makes our  
50 lattice more complex to study.

After the introduction, we present the basic concepts to understand the  
article. Auxiliary information about t-norms on discrete chains is exposed in  
Section 3. More precisely, we compute the number of some classes of t-norms  
that are used in the following section. Section 4 is the main one and each t-norm  
55 is completely described. Results are separated according to the properties of  
the t-norms. A significant class of t-norms is the class of Archimedean t-norms  
(see for instance [34, 37]). Section 5 determines what are the Archimedean t-  
norms. Another relevant class is the set of divisible t-norms. This property  
is the proper equivalent to the continuity of t-norms on the interval  $[0, 1]$  in  
60 the framework of discrete t-norms (see [24]). When the lattice is a discrete  
chain, these t-norms are exactly the 1-Lipschitz t-norms and they are well-  
known (see [25]). Also, t-norms generate partial orders, and whenever a t-norm  
is divisible, the corresponding partial order is a lattice (see [2]). More details  
about divisible t-norms can be found in [18]. Section 6 is devoted to describing  
65 them. Finally, Section 7 highlights the importance of the duality between t-  
norms and t-conorms. Each result written in the previous parts has a dual  
result for t-conorms.

## 2. Preliminaries

We introduce the notions that will be used throughout the article.

70 **Definition 2.1** ([6]). *Let  $(L, \leq)$  be a lattice. We say that  $L$  is a bounded lattice  
if there are  $0, 1 \in L$  such that  $0 \leq x$  and  $x \leq 1$  for each  $x \in L$ .*

Notice that each finite lattice is a bounded lattice.

4  
5  
6  
7  
8  
9 The first definition of the t-norm was given by Menger in [27]. The following  
10 two notions are the generalization of t-norms and t-conorms from the interval  
11  $[0, 1]$  to a bounded lattice  $L$ .  
12  
13

14 **Definition 2.2** ([13]). *Let  $(L, \leq, 0, 1)$  be a bounded lattice. A function  $T : L \times L \rightarrow L$  is called a triangular norm (a t-norm) on  $L$  if it satisfies the following axioms:*

90 Computationally, in [12] De Baets and Mesiar calculated the number of t-norms on discrete chains. We show that data in Table 1. Due to the duality between t-norms and t-conorms, this table provides the same information about the number of t-conorms because a discrete chain is a self-dual lattice (more information in Section 7).

48  
49  
50

### 95 3. Auxiliary information about t-norms on chains

51 To illustrate the results of the paper, in this section we provide the number of t-norms defined on a chain that are used in the main section.

52  
53  
54 Given a discrete chain

$$C = \{0, \alpha_1, \alpha_2, \dots, \alpha_n, 1\}$$

$n$	$P_n$	$n$	$P_n$
1	2	7	13775
2	6	8	86417
3	22	9	590489
4	94	10	4446029
5	451	11	37869449
6	2386	12	382549464

Table 1: Numbers of t-norms on discrete chains with  $n + 2$  elements, that is,  $n$  non-trivial elements.

satisfying  $0 < \alpha_1 < \alpha_2 < \dots < \alpha_n < 1$ , we present the number of the following families of t-norms on  $C$ .

- 100 1. T-norms  $T$  on the chain  $C$  satisfying  $T(\alpha_1, \alpha_1) = 0$ , that is, t-norms on a discrete chain satisfying that the smallest non-trivial element is not idempotent. The number of them is denoted by  $A_n$ . See Column 2 in Table 2.
2. T-norms  $T$  on the chain  $C$  satisfying  $T(\alpha_1, \alpha_1) = \alpha_1$ , that is, t-norms on a discrete chain satisfying that the smallest non-trivial element is idempotent. The number of them is denoted by  $A'_n$ . See Column 3 in Table 2.
- 105 3. T-norms  $T$  on the chain  $C$  satisfying  $T(\alpha_n, \alpha_n) < \alpha_n$ , that is, t-norms on a chain satisfying that the biggest non-trivial element is not idempotent. The number of them is denoted by  $B_n$ . See Column 4 in Table 2.
4. T-norms  $T$  on the chain  $C$  satisfying  $T(\alpha_n, \alpha_n) = \alpha_n$ , that is, t-norms on a chain satisfying that the biggest non-trivial element is idempotent. The number of them is denoted by  $B'_n$ . See Column 5 in Table 2.
- 110 5. Fixed a  $k \in \{1, 2, \dots, n\}$ , t-norms  $T_k$  on the chain  $C$  satisfying  $T_k(\alpha_1, \alpha_n) = 0$  and  $T_k(\alpha_n, \alpha_n) \leq \alpha_k$ . See Table 3.

Obviously, for each  $n \in \mathbb{N}$ , we have that  $A_n + A'_n = P_n$  (see Columns 2 and 3) and  $B_n + B'_n = P_n$  (see Columns 4 and 5). Moreover,  $A'_n = P_{n-1}$ .

Table 3: For each  $k$  and  $n$ , the number of t-norms  $T_k$  on a discrete chain with  $n + 2$  elements satisfying that  $T_k(\alpha_1, \alpha_n) = 0$  and  $T_k(\alpha_n, \alpha_n) \leq \alpha_k$ .

the induced order:

$$C_\beta = \{0, \beta_1, \dots, \beta_p, 1\}$$

$$C_\gamma = \{0, \gamma_1, \dots, \gamma_q, 1\}$$

Therefore,  $C_\beta$  and  $C_\gamma$  are sublattices of  $L$  (see Figure 1).

**Lemma 4.1.** *If  $T$  is a t-norm on  $L$ , then  $T(\beta_i, \gamma_j) = 0$  for each  $i \in \{1, 2, \dots, p\}$  and  $j \in \{1, 2, \dots, q - 1\}$ .*

*Proof.*  $T(\beta_i, \gamma_j) \leq \beta_i \wedge \gamma_j = 0$  for each  $i \in \{1, 2, \dots, p\}$  and  $j \in \{1, 2, \dots, q - 1\}$ .  $\square$

Now, we present each t-norm on  $L$ . We have divided the propositions according to the values of  $T(\beta_1, \beta_1)$  and  $T(\gamma_q, \gamma_q)$ .

**Proposition 4.2.** *Each t-norm  $T$  on  $L$  satisfying  $T(\beta_1, \beta_1) = \beta_1$  and  $T(\gamma_q, \gamma_q) =$*

$\beta_1$  is expressed as follows:

$$T(x, y) = \begin{cases} T'(x, y) & \text{if } x, y \in C_\beta, \\ x \wedge y & \text{if } x = 1 \text{ or } y = 1, \\ \beta_1 & \text{if } (x, y) \in \{(\beta_i, \gamma_q), (\gamma_q, \beta_i) \mid i \in \{1, \dots, p\}\}, \\ \beta_1 & \text{if } x = y = \gamma_q, \\ 0 & \text{otherwise.} \end{cases} \quad (1)$$

where  $T'$  is a t-norm on  $C_\beta$  satisfying  $T'(\beta_1, \beta_1) = \beta_1$ .

*Proof.* Firstly, we prove that each t-norm  $T$  on  $L$  satisfying  $T(\beta_1, \beta_1) = \beta_1$  and  $T(\gamma_q, \gamma_q) = \beta_1$  has this expression. Finally, we will prove that each binary operator  $T$  on  $L$  which has this expression is a t-norm satisfying the mentioned conditions.

If  $T$  is a t-norm on  $L$ , then  $T|_{C_\beta^2}$  is a t-norm on  $C_\beta$ . Moreover, since  $T(\beta_1, \beta_1) = \beta_1$ , we have that  $T|_{C_\beta^2}(\beta_1, \beta_1) = \beta_1$ . Put  $T' = T|_{C_\beta^2}$ .

If  $x = 1$  or  $y = 1$ , then  $T(x, y) = x \wedge y$  because  $T$  is a t-norm. Without loss of generality due to commutativity, take  $x = \beta_i$  for some  $i \in \{1, \dots, p\}$  and  $y = \gamma_q$ . By monotonicity,

$$\beta_1 = T(\beta_1, \beta_1) \leq T(x, y) \leq \beta_i \wedge \gamma_q = \beta_1.$$

Under our hypothesis,  $T(\gamma_q, \gamma_q) = \beta_1$ .

In the last case, we have that  $T(\gamma_i, \gamma_q) \leq T(\gamma_q, \gamma_q) = \beta_1$  for each  $i \in \{1, \dots, q-1\}$ . This implies that  $T(\gamma_i, \gamma_q) \leq \gamma_i \wedge \beta_1 = 0$ . Consequently,  $T(\gamma_i, \gamma_j) \leq T(\gamma_i, \gamma_q) = 0$  for each  $i, j \in \{1, \dots, q-1\}$ . Lemma 4.1 provides the rest of values.

Now, consider a binary operator  $T$  expressed by formula (1). The element 1 is the neutral element by definition of  $T$  and commutativity is straightforward. To prove the monotonicity, let us take  $x, y, z \in L \setminus \{1\}$  such that  $x \leq y$  (if one of them is equal to 1, the condition of monotonicity is trivial). If all of them belong to  $C_\beta$ , then  $T(x, z) = T'(x, z) \leq T'(y, z) = T(y, z)$ . If all of them belong to  $C_\gamma$ , then monotonicity is clear due to the definition of  $T$ . Otherwise:

1. If  $x \in C_\beta$ , necessarily  $y \in C_\beta$ . Hence,  $z = \gamma_i$  for some  $i \in \{1, \dots, q\}$ .

When  $z = \gamma_q$ , then  $T(x, z) = \beta_1 = T(y, z)$  and when  $z \neq \gamma_q$ , then  $T(x, z) = 0 \leq T(y, z)$ .

2. If  $x \in C_\gamma$ , then  $y \in C_\gamma$  and  $z \in C_\beta$ . If  $x = \gamma_q$ , then  $x = y$  and the condition of monotonicity is trivial. If  $x \neq \gamma_q$ , then  $T(x, z) = 0 \leq T(y, z)$ .

150 Finally, let us check that  $T$  is associative. Take  $x, y, z \in L \setminus \{0, 1\}$  (whenever one of them is equal to 0 or 1, associativity is trivial).

If  $x, y, z \in C_\beta$ , then  $T(x, T(y, z)) = T'(x, T'(y, z)) = T'(T'(x, y), z) = T(T(x, y), z)$ .

If one of them is equal to  $\gamma_i$  for some  $i < q$ , then  $T(x, T(y, z)) = 0 = T(T(x, y), z)$  by definition of  $T$ . Therefore, the last case must consider one of them equal to  $\gamma_q$ . It is easy to check by definition of  $T$  that  $T(T(x, y), z) = \beta_1 = T(x, T(y, z))$ . We conclude that  $T$  is a t-norm on  $L$ . Besides,  $T(\beta_1, \beta_1) = \beta_1$  and  $T(\gamma_q, \gamma_q) = \beta_1$ .  $\square$

**Proposition 4.3.** *Each t-norm  $T$  on  $L$  satisfying  $T(\beta_1, \beta_1) = \beta_1$  and  $T(\gamma_q, \gamma_q) = \gamma_q$  is expressed as follows:*

$$T(x, y) = \begin{cases} T_1(x, y) & \text{if } x, y \in C_\beta, \\ T_2(x, y) & \text{if } x, y \in C_\gamma, \\ \beta_1 & \text{if } (x, y) \in \{(\beta_i, \gamma_q), (\gamma_q, \beta_i) \mid i \in \{1, \dots, p\}\}, \\ 0 & \text{otherwise.} \end{cases} \quad (2)$$

where  $T_1$  is a t-norm on  $C_\beta$  satisfying  $T_1(\beta_1, \beta_1) = \beta_1$  and  $T_2$  is a t-norm on  $C_\gamma$  satisfying  $T_2(\gamma_q, \gamma_q) = \gamma_q$ .

*Proof.* Firstly, we prove that each t-norm  $T$  on  $L$  satisfying  $T(\beta_1, \beta_1) = \beta_1$  and  $T(\gamma_q, \gamma_q) = \gamma_q$  has this expression. Finally, we will prove that each binary operator  $T$  on  $L$  which has this expression is a t-norm satisfying the mentioned conditions.

165 If  $T$  is a t-norm on  $L$ , then  $T|_{C_\beta^2}$  and  $T|_{C_\gamma^2}$  are t-norms on  $C_\beta$  and  $C_\gamma$  respectively. Notice that we can guarantee that  $T|_{C_\gamma^2}$  is a t-norm because  $T(\gamma_q, \gamma_q) \in C_\gamma$ , and therefore, it is well-defined. Moreover, since  $T(\beta_1, \beta_1) = \beta_1$  and  $T(\gamma_q, \gamma_q) = \gamma_q$ , we can set  $T_1 = T|_{C_\beta^2}$  and  $T_2 = T|_{C_\gamma^2}$ .

Without loss of generality due to commutativity, take  $x = \beta_i$  for some  $i \in \{1, \dots, p\}$  and  $y = \gamma_q$ . By monotonicity,

$$\beta_1 = T(\beta_1, \beta_1) \leq T(x, y) \leq \beta_i \wedge \gamma_q = \beta_1.$$

The last case is Lemma 4.1.

Now, consider a binary operator  $T$  expressed by formula (2). The element 1 is the neutral element because  $T_1$  and  $T_2$  are t-norms, and commutativity is straightforward for the same reason. To prove the monotonicity, let us take  $x, y, z \in L \setminus \{1\}$  such that  $x \leq y$  (if one of them is equal to 1, the condition of monotonicity is trivial). If all of them belong to  $C_\beta$ , then  $T(x, z) = T_1(x, z) \leq T_1(y, z) = T(y, z)$ . Analogously, if all of them belong to  $C_\gamma$ . Otherwise:

1. If  $x \in C_\beta$ , necessarily  $y \in C_\beta$ . Hence,  $z = \gamma_i$  for some  $i \in \{1, \dots, q\}$ .

When  $z = \gamma_q$ , then  $T(x, z) = \beta_1 = T(y, z)$  and when  $z \neq \gamma_q$ , then  $T(x, z) = 0 \leq T(y, z)$ .

2. If  $x \in C_\gamma$ , the procedure is analogous.

Finally, let us check that  $T$  is associative. Take  $x, y, z \in L \setminus \{0, 1\}$  (whenever one of them is equal to 0 or 1, associativity is trivial). If  $x, y, z \in C_\beta$ , then  $T(x, T(y, z)) = T_1(x, T_1(y, z)) = T_1(T_1(x, y), z) = T(T(x, y), z)$ . Analogously, if  $x, y, z \in C_\gamma$ , then  $T(x, T(y, z)) = T_2(x, T_2(y, z)) = T_2(T_2(x, y), z) = T(T(x, y), z)$ .

Therefore, let us suppose that some of them (but not all) belong to  $C_\beta$  and the rest belongs to  $C_\gamma$ . If one of them is equal to  $\gamma_j$  for some  $j < q$ , then  $T(x, T(y, z)) = 0 = T(T(x, y), z)$  by definition of  $T$ . Otherwise, we have two possibilities: exactly one or two elements are equal to  $\gamma_q$ . In any case, we have easily that  $T(T(x, y), z) = \beta_1 = T(x, T(y, z))$ . We conclude that  $T$  is a t-norm on  $L$  satisfying  $T(\beta_1, \beta_1) = \beta_1$  and  $T(\gamma_q, \gamma_q) = \gamma_q$ .  $\square$

The following result involves a class of t-norms on chains depending on a value  $k \in \{1, 2, \dots, p\}$ .

**Proposition 4.4.** Each t-norm  $T$  on  $L$  satisfying  $T(\beta_1, \beta_1) = 0$  and  $T(\gamma_q, \gamma_q) = \beta_1$  is expressed as follows: There is  $k \in \{1, 2, \dots, p\}$  such that

$$T(x, y) = \begin{cases} T_k(x, y) & \text{if } x, y \in C_\beta, \\ x \wedge y & \text{if } x = 1 \text{ or } y = 1, \\ \beta_1 & \text{if } (x, y) \in \{(\beta_i, \gamma_q), (\gamma_q, \beta_i) \mid i > k\}, \\ \beta_1 & \text{if } x = y = \gamma_q, \\ 0 & \text{otherwise.} \end{cases} \quad (3)$$

where  $T_k$  is a t-norm on  $C_\beta$  satisfying  $T_k(\beta_1, \beta_p) = 0$  and  $T_k(\beta_p, \beta_p) \leq \beta_k$ .

*Proof.* Firstly, we prove that each t-norm  $T$  on  $L$  satisfying  $T(\beta_1, \beta_1) = 0$  and  $T(\gamma_q, \gamma_q) = \beta_1$  has this expression. Finally, we will prove that each binary operator  $T$  on  $L$  which has this expression is a t-norm satisfying the mentioned conditions.

Suppose that  $T$  is a t-norm on  $L$ . First of all, notice that  $T(\beta_1, \gamma_q) = 0$  because if  $T(\beta_1, \gamma_q) = \beta_1$ , on the one hand

$$T(T(\beta_1, \gamma_q), \gamma_q) = T(\beta_1, \gamma_q) = \beta_1,$$

and on the other hand

$$T(\beta_1, T(\gamma_q, \gamma_q)) = T(\beta_1, \beta_1) = 0,$$

which is a contradiction.

$$\beta_1 = T(\beta_1, \gamma_q) = T(\beta_1, T(\gamma_q, \gamma_q)) = T(T(\beta_1, \gamma_q), \gamma_q) = T(\beta_1, \beta_1) = 0,$$

that is a contradiction. Taking this into account, let us check that  $T(\beta_1, \beta_p) = 0$ .

By associativity, we have

$$T(\beta_1, \beta_p) = T(T(\gamma_q, \gamma_q), \beta_p) = T(\gamma_q, T(\gamma_q, \beta_p)) \leq T(\gamma_q, \beta_1) = 0.$$

Now, take  $k = \max\{i \in \{1, 2, \dots, p\} \mid T(\beta_i, \gamma_q) = 0\}$ . Clearly, the set is not empty because  $T(\beta_1, \gamma_q) = 0$ . Let us prove that  $T(\beta_p, \beta_p) \leq \beta_k$ . By contradiction, suppose that  $T(\beta_p, \beta_p) > \beta_k$ , by associativity and monotonicity, we have the following contradiction

$$\beta_1 = T(\gamma_q, T(\beta_p, \beta_p)) = T(T(\gamma_q, \beta_p), \beta_p) \leq T(\beta_1, \beta_p) = 0.$$

Therefore, putting  $T_k = T|_{C_\beta^2}$ , we conclude that  $T_k$  is a t-norm on  $C_\beta$  satisfying  $T_k(\beta_1, \beta_p) = 0$  and  $T_k(\beta_p, \beta_p) \leq \beta_k$ .

Moreover, by definition of  $k$ ,  $T(x, y) = \beta_1$  for each pair  $(x, y) \in \{(\beta_i, \gamma_q), (\gamma_q, \beta_i)\}$  with  $i > k$ . Finally, taking into account the definition of  $k$ , we have that  $T(\beta_i, \gamma_q) = 0$  whenever  $i \leq k$  and using Lemma 4.1, we have that  $T(\beta_i, \gamma_j) = 0$  for each  $i \in \{1, 2, \dots, p\}$  and  $j \in \{1, 2, \dots, q-1\}$ .

Now, let us consider a binary operator  $T$  expressed by formula (3) and let us prove that it is a t-norm. Monotonicity, commutativity and the fact that the element 1 is the neutral element are straightforward by definition of  $T$ .

To prove the associative property, take  $x, y, z \in L \setminus \{0, 1\}$  (whenever one of them is equal to 0 or 1, associativity is trivial).

If one of them belongs to the set  $\{\beta_1, \gamma_1, \gamma_2, \dots, \gamma_{q-1}\}$ , then  $T(T(x, y), z) = 0 = T(x, T(y, z))$  by definition of  $T$ . Hence, let us suppose that  $x, y, z \in \{\beta_2, \beta_3, \dots, \beta_p, \gamma_q\}$ . If none of them is equal to  $\gamma_q$ , then

$$T(x, T(y, z)) = T_k(x, T_k(y, z)) = T_k(T_k(x, y), z) = T(T(x, y), z).$$

Therefore, we can consider that  $\gamma_q \in \{x, y, z\}$  in the rest of the proof. If all of them are equal to  $\gamma_q$ , it is trivial. If exactly two of the elements are equal to  $\gamma_q$ , using that  $T(\gamma_q, \gamma_q) = \beta_1$  and the fact that  $T(\beta_1, \beta_i) = 0$  for each  $i \in \{1, 2, \dots, p\}$ , we obtain that  $T(x, T(y, z)) = 0 = T(T(x, y), z)$ . If only one of the elements is equal to  $\gamma_q$ , we have the following three cases:

1.  $x = \gamma_q$ . We have that

$$T(x, T(y, z)) \leq T(\gamma_q, T(\beta_p, \beta_p)) \leq T(\gamma_q, \beta_k) = 0$$

and

$$T(T(x, y), z) \leq T(T(\gamma_q, \beta_p), \beta_p) \leq T(\beta_1, \beta_p) = 0.$$

2.  $y = \gamma_q$ . We have that

$$T(x, T(y, z)) \leq T(\beta_p, \beta_1) = 0$$

and

$$T(T(x, y), z) \leq T(\beta_1, \beta_p) = 0.$$

3.  $z = \gamma_q$ . It is similar to the first case.

215 We conclude that  $T$  is a t-norm on  $L$ . In addition,  $T(\beta_1, \beta_1) \leq T(\beta_1, \beta_p) = 0$   
and  $T(\gamma_q, \gamma_q) = \beta_1$ .  $\square$

**Proposition 4.5.** *Each t-norm  $T$  on  $L$  satisfying  $T(\beta_1, \beta_1) = 0$  and  $T(\gamma_q, \gamma_q) \in C_\gamma \setminus \{\gamma_q\}$  is expressed as one of the following two formulas:*

$$T(x, y) = \begin{cases} T_1(x, y) & \text{if } x, y \in C_\beta, \\ T_2(x, y) & \text{if } x, y \in C_\gamma, \\ 0 & \text{otherwise.} \end{cases} \quad (4)$$

where  $T_1$  is a t-norm on  $C_\beta$  satisfying  $T_1(\beta_1, \beta_1) = 0$  and  $T_2$  is a t-norm on  $C_\gamma$  satisfying  $T_2(\gamma_q, \gamma_q) < \gamma_q$ , or, there is  $k \in \{2, 3, \dots, p\}$  such that

$$T(x, y) = \begin{cases} T_1(x, y) & \text{if } x, y \in C_\beta, \\ T_2(x, y) & \text{if } x, y \in C_\gamma, \\ \beta_1 & \text{if } (x, y) \in \{(\beta_i, \gamma_q), (\gamma_q, \beta_i) \mid i \geq k\}, \\ 0 & \text{otherwise.} \end{cases} \quad (5)$$

where  $T_2$  is a t-norm on  $C_\gamma$  satisfying  $T_2(\gamma_q, \gamma_q) < \gamma_q$  and  $T_1$  is a t-norm on  $C_\beta$  satisfying

1.  $T_1(\beta_i, \beta_1) = 0$  for  $i < k$ .
2. If  $T_1(\beta_k, \beta_k) = \beta_k$ , then

$$T_1(\beta_1, \beta_p) = T_1(\beta_1, \beta_k) = \beta_1.$$

3. If  $T_1(\beta_k, \beta_k) < \beta_k$ , then

$$T_1(\beta_1, \beta_p) = T_1(\beta_1, \beta_k) = 0$$

and

$$T(\beta_p, \beta_p) \leq \beta_{k-1}.$$

220 *Proof.* Firstly, we prove that each t-norm  $T$  on  $L$  satisfying  $T(\beta_1, \beta_1) = 0$  and  $T(\gamma_q, \gamma_q) \in C_\gamma \setminus \{\gamma_q\}$  has one of these expressions. Finally, we will prove that each binary operator  $T$  on  $L$  which has one of these expressions is a t-norm satisfying the mentioned conditions.

Suppose that  $T$  is a t-norm on  $L$ . We consider two possibilities:

1. Case  $T(\beta_p, \gamma_q) = 0$ . By monotonicity,  $T(\beta_i, \gamma_q) = 0$  for all  $i \in \{1, 2, \dots, p\}$ .

Since  $T$  is a t-norm satisfying  $T(\gamma_q, \gamma_q) \in C_\gamma \setminus \{\gamma_q\}$ , the restriction  $T_2 := T|_{C_\gamma}$  is a t-norm on  $C_\gamma$  satisfying the same condition. Also, the restriction  $T_1 = T|_{C_\beta}$  is a t-norm on  $C_\beta$  satisfying  $T_1(\beta_1, \beta_1) = 0$ . Therefore,  $T$  is given by formula (4).

2. Case  $T(\beta_p, \gamma_q) = \beta_1$ . We are going to check that  $T$  is given by formula (5). Take

$$k = \min\{j \mid T(\beta_j, \gamma_q) = \beta_1\}.$$

By monotonicity  $T(\beta_1, \gamma_q) \leq T(\gamma_q, \gamma_q) \leq \gamma_{q-1}$ , hence  $T(\beta_1, \gamma_q) \leq \beta_1 \wedge \gamma_{q-1} = 0$ . Since  $T(\beta_1, \gamma_q) = 0$ , we have that  $k \in \{2, 3, \dots, p\}$ . By monotonicity and commutativity,  $T(\beta_i, \gamma_q) = T(\gamma_q, \beta_i) = \beta_i$  for all  $i \geq k$ . Analogously to the previous case, we have that  $T_1 := T|_{C_\beta}$  is a t-norm on  $C_\beta$  satisfying  $T_1(\beta_1, \beta_1) = 0$  and  $T_2 := T|_{C_\gamma}$  is a t-norm on  $C_\gamma$  satisfying  $T_2(\gamma_q, \gamma_q) \in C_\gamma \setminus \{\gamma_q\}$ . If  $i < k$ , we have

$$T(\beta_1, \beta_i) = T(\beta_1, \beta_i) = T(T(\gamma_q, \beta_k), \beta_i) = T(\gamma_q, T(\beta_k, \beta_i)) \leq T(\gamma_q, \beta_i) = 0.$$

Now, we will check that  $T_1(\beta_k, \beta_1) = T_1(\beta_p, \beta_1)$ :

$$T(\beta_k, \beta_1) = T(\beta_k, T(\gamma_q, \beta_p)) = T(T(\beta_k, \gamma_q), \beta_p) = T(\beta_1, \beta_p) = T(\beta_p, \beta_1).$$

If  $T_1(\beta_k, \beta_k) = \beta_k$ , we have that

$$T(\beta_1, \beta_p) = T(\beta_1, \beta_k) = T(T(\gamma_q, \beta_k), \beta_k) = T(\gamma_q, T(\beta_k, \beta_k)) = T(\gamma_q, \beta_k) = \beta_1.$$

If  $T_1(\beta_k, \beta_k) < \beta_k$ , we have that

$$T(\beta_1, \beta_p) = T(\beta_1, \beta_k) = T(T(\gamma_q, \beta_k), \beta_k) = T(\gamma_q, T(\beta_k, \beta_k)) \leq T(\gamma_q, \beta_{k-1}) = 0$$

and

$$0 = T(\beta_1, \beta_p) = T(T(\gamma_q, \beta_p), \beta_p) = T(\gamma_q, T(\beta_p, \beta_p))$$

230

hence,  $T(\beta_p, \beta_p) < \beta_k$ . Therefore,  $T_1 = T|_{C_\beta}$  satisfies the required properties.

1  
2  
3  
4  
5  
6  
7  
8  
9 Now, let us consider a binary operator  $T$  expressed by formula (4) or (5)  
10 and let us prove that it is a t-norm. If  $T$  is given by the first one, axioms of  
11 t-norms are trivially fulfilled.  
12

13  
14 235 We study when  $T$  is given by formula (5). Monotonicity, commutativity  
15 and the fact that the element 1 is the neutral element are straightforward by  
16 definition of  $T$  taking into account that  $T_1$  and  $T_2$  are t-norms.  
17

18 To prove the associative property, take  $x, y, z \in L \setminus \{0, 1\}$  (whenever one of  
19 them is equal to 0 or 1, associativity is trivial).  
20

21  
22 240 If  $x, y, z \in C_\beta$  or  $x, y, z \in C_\gamma$ , then  $T(T(x, y), z) = T(x, T(y, z))$  because  $T_1$   
23 and  $T_2$  are t-norms on  $C_\beta$  and  $C_\gamma$  respectively.  
24

25 Therefore, in the rest of the proof let us suppose that some of them (but  
26 not all) belong to  $C_\beta$  and the rest belongs to  $C_\gamma$ . If one of them is equal to  
27  $\gamma_j$  for some  $j < q$ , then  $T(x, T(y, z)) = 0 = T(T(x, y), z)$  using monotonicity.  
28  
29 245 Otherwise, at least one of them is equal to  $\gamma_q$ . If exactly two of them are equal to  
30  $\gamma_q$ , it is easy to check that  $T(x, T(y, z)) = 0 = T(T(x, y), z)$  using monotonicity  
31 and the fact  $T(\beta_1, \gamma_q) = 0$ . If only one of the elements is equal to  $\gamma_q$ , we have  
32 three cases:  
33  
34  
35

36 1.  $x = \gamma_q, y = \beta_i$  and  $z = \beta_j$ .

37 If  $i, j < k$ , then

$$38 T(T(\gamma_q, \beta_i), \beta_j) = T(0, \beta_j) = 0$$

39 and

$$40 T(\gamma_q, T(\beta_i, \beta_j)) \leq T(\gamma_q, \beta_i \wedge \beta_j) = 0.$$

41  
42 If  $i < k$  and  $j \geq k$ , then

$$43 T(T(\gamma_q, \beta_i), \beta_j) = T(0, \beta_j) = 0$$

44 and

$$45 T(\gamma_q, T(\beta_i, \beta_j)) \leq T(\gamma_q, \beta_i) = 0.$$

46  
47 If  $i \geq k$  and  $j < k$ , then

$$48 T(T(\gamma_q, \beta_i), \beta_j) = T(\beta_1, \beta_j) = 0$$

and

$$T(\gamma_q, T(\beta_i, \beta_j)) \leq T(\gamma_q, \beta_j) = 0.$$

250 If  $i, j \geq k$ , then we consider the following two cases:

A)  $T(\beta_k, \beta_k) = \beta_k$ .

$$T(T(\gamma_q, \beta_i), \beta_j) = T(\beta_1, \beta_j) = \beta_1$$

and

$$T(\gamma_q, T(\beta_i, \beta_j)) \geq T(\gamma_q, T(\beta_k, \beta_k)) = T(\gamma_q, \beta_k) = \beta_1.$$

B)  $T(\beta_k, \beta_k) < \beta_k$ .

$$T(T(\gamma_q, \beta_i), \beta_j) = T(\beta_1, \beta_j) = 0$$

and

$$T(\gamma_q, T(\beta_i, \beta_j)) \leq T(\gamma_q, T(\beta_p, \beta_p)) \leq T(\gamma_q, \beta_{k-1}) = 0.$$

2.  $x = \beta_i, y = \gamma_q$  and  $z = \beta_j$ . If  $i < k$  or  $j < k$ , it is easy to check that

$$T(\beta_i, T(\gamma_q, \beta_j)) = 0 = T(T(\beta_i, \gamma_q), \beta_j).$$

Otherwise, let us assume that  $i, j \geq k$ . Then,

$$T(\beta_i, T(\gamma_q, \beta_j)) = T(\beta_i, \beta_1) = T(\beta_p, \beta_1)$$

and

$$T(T(\beta_i, \gamma_q), \beta_j) = T(\beta_1, \beta_j) = T(\beta_1, \beta_p).$$

3.  $x = \beta_i, y = \beta_j$  and  $z = \gamma_q$ . It is similar to the first case.

We conclude that  $T$  is a t-norm on  $L$ . Moreover,  $T(\beta_1, \beta_1) \leq T(\beta_1, \beta_p) = 0$  and  $T(\gamma_q, \gamma_q) = T'(\gamma_q, \gamma_q) \in C_\gamma \setminus \{\gamma_q\}$ .  $\square$

**Proposition 4.6.** *Each t-norm  $T$  on  $L$  satisfying  $T(\beta_1, \beta_1) = 0, T(\gamma_q, \gamma_q) = \gamma_q$ , and  $T(\beta_1, \gamma_q) = \beta_1$  is expressed as follows:*

$$T(x, y) = \begin{cases} T'(x, y) & \text{if } x, y \in C_\gamma, \\ x \wedge y & \text{if } x = 1 \text{ or } y = 1, \\ \beta_1 & \text{if } (x, y) \in \{(\beta_i, \gamma_q), (\gamma_q, \beta_i) \mid i \geq 1\}, \\ 0 & \text{otherwise.} \end{cases} \quad (6)$$

1  
2  
3  
4  
5  
6  
7  
8  
9 where  $T'$  is a t-norm on  $C_\gamma$  satisfying  $T'(\gamma_q, \gamma_q) = \gamma_q$ .

10  
11 *Proof.* Firstly, we prove that each t-norm  $T$  on  $L$  satisfying  $T(\beta_1, \beta_1) = 0$ ,  
12  $T(\gamma_q, \gamma_q) = \gamma_q$  and  $T(\beta_1, \gamma_q) = \beta_1$  has this expression. Finally, we will prove  
13 that each binary operator  $T$  on  $L$  which has this expression is a t-norm satisfying  
14 the mentioned conditions.  
15  
16

17 If  $T$  is a t-norm on  $L$  that satisfies the hypotheses, we have that

$$\beta_1 = T(\beta_1, \gamma_q) \leq T(\beta_i, \gamma_q) \leq \beta_2 \wedge \gamma_q \leq \beta_1$$

18  
19 for each  $i \geq 1$ . Moreover,  $T' = T|_{C_\gamma^2}$  is a t-norm on  $C_\gamma$  satisfying  $T'(\gamma_q, \gamma_q) =$   
20  $\gamma_q$ . Now, we are going to prove that  $T(\beta_i, \beta_j) = 0$  for each  $i, j \in \{1, 2, \dots, p\}$ .  
21 By hypothesis,  $T(\beta_1, \beta_1) = 0$ . Firstly, by contradiction, let us suppose that  
22  $T(\beta_1, \beta_i) = \beta_1$  for some  $i \in \{1, 2, \dots, p\}$ . Hence,  $\beta_1 = T(\gamma_q, \beta_i)$  by monotonicity.  
23  
24 Therefore,  
25  
26

$$0 = T(\beta_1, \beta_1) = T(T(\gamma_q, \beta_i), \beta_1) = T(\gamma_q, T(\beta_i, \beta_1)) = T(\gamma_q, \beta_1) = \beta_1,$$

27  
28 that is a contradiction. We conclude that  $T(\beta_1, \beta_i) = 0$  for each  $i \in \{1, 2, \dots, p\}$ .  
29 Secondly, let us check that  $T(\beta_i, \beta_j) = 0$  for each  $i, j \in \{1, 2, \dots, p\}$ . By contra-  
30 diction, assume that  $T(\beta_i, \beta_j) \geq \beta_1$  for some  $i, j \in \{1, 2, \dots, p\}$ . Then, taking  
31 into account that  $\beta_1 = T(\gamma_q, \beta_j)$  as a consequence of the hypothesis due to  
32 monotonicity, we have that  
33  
34

$$0 = T(\beta_1, \beta_i) = T(T(\gamma_q, \beta_j), \beta_i) = T(\gamma_q, T(\beta_j, \beta_i)) \leq T(\gamma_q, \beta_1) = \beta_1,$$

35  
36 that is a contradiction. Hence  $T(\beta_i, \beta_j) = 0$  for each  $i, j \in \{1, 2, \dots, p\}$ . The rest  
37 of values are obtained from Lemma 4.1.  
38  
39

40  
41 Now, let us consider a binary operator  $T$  expressed by formula (6). Mono-  
42 tonicity, commutativity and the fact that the element 1 is the neutral element  
43 are straightforward by definition of  $T$  taking into account that  $T'$  is a t-norm  
44 on  $C_\gamma$ . Let us check that  $T$  is associative. Take  $x, y, z \in L \setminus \{0, 1\}$  (whenever  
45 one of them is equal to 0 or 1, associativity is trivial).  
46  
47

48 If all of them belong to  $C_\gamma$ , then

$$T(x, T(y, z)) = T'(x, T'(y, z)) = T'(T'(x, y), z) = T(T(x, y), z).$$

If all of them belong to  $C_\beta$ , then

$$T(x, T(y, z)) = 0 = T(T(x, y), z).$$

Therefore, let us suppose that some of them (but not everyone) belong to  $C_\beta$  and the rest belongs to  $C_\gamma$ . If one of them is equal to  $\gamma_j$  for some  $j < q$ , then  $T(x, T(y, z)) = 0 = T(T(x, y), z)$  by definition of  $T$ . Otherwise, the elements that belong to  $C_\gamma$  are equal to  $\gamma_q$ . Since  $T(\gamma_q, \beta_i) = \beta_1$  and  $T(\beta_i, \beta_j) = 0$  for each  $i, j \in \{1, 2, \dots, p\}$ , we have that if exactly two of them are equal to  $\gamma_q$ , then

$$T(x, T(y, z)) = \beta_1 = T(T(x, y), z)$$

and if exactly one of them is equal to  $\gamma_q$ , then

$$T(x, T(y, z)) = 0 = T(T(x, y), z).$$

Therefore,  $T$  is a t-norm on  $L$  and it satisfies  $T(\beta_1, \beta_1) = 0$ ,  $T(\gamma_q, \gamma_q) = T'(\gamma_q, \gamma_q) = \gamma_q$ , and  $T(\beta_1, \gamma_q) = \beta_1$ .  $\square$

**Proposition 4.7.** *Each t-norm  $T$  on  $L$  satisfying  $T(\gamma_q, \gamma_q) = \gamma_q$  and  $T(\beta_1, \gamma_q) = 0$  is expressed as follows:*

$$T(x, y) = \begin{cases} T_1(x, y) & \text{if } x, y \in C_\beta, \\ T_2(x, y) & \text{if } x, y \in C_\gamma, \\ 0 & \text{otherwise.} \end{cases} \quad (7)$$

where  $T_1$  is a t-norm on  $C_\beta$  satisfying  $T_1(\beta_1, \beta_1) = 0$ , and  $T_2$  is a t-norm on  $C_\gamma$  satisfying  $T_2(\gamma_q, \gamma_q) = \gamma_q$ .

*Proof.* Firstly, we prove that each t-norm  $T$  on  $L$  satisfying  $T(\beta_1, \beta_1) = 0$ ,  $T(\gamma_q, \gamma_q) = \gamma_q$  and  $T(\beta_1, \gamma_q) = 0$  has this expression. Finally, we will prove that each binary operator  $T$  on  $L$  which has this expression is a t-norm satisfying the mentioned conditions.

If  $T$  is a t-norm on  $L$ , then  $T|_{C_\beta^2}$  and  $T|_{C_\gamma^2}$  are t-norms on  $C_\beta$  and  $C_\gamma$  respectively. Notice that we can guarantee that  $T|_{C_\gamma^2}$  is well-defined because  $T(\gamma_q, \gamma_q) = \gamma_q \in C_\gamma$ . Moreover, since  $T(\beta_1, \beta_1) = 0$  and  $T(\gamma_q, \gamma_q) = \gamma_q$ , we can

put  $T_1 = T|_{C_\beta^2}$  and  $T_2 = T|_{C_\gamma^2}$ . Now, let us check that  $T(\beta_i, \gamma_q) = 0$  for each  $i \in \{1, 2, \dots, p\}$ . By monotonicity and associativity, we have

$$0 = T(\beta_1, \gamma_q) \geq T(T(\beta_i, \gamma_q), \gamma_q) = T(\beta_i, T(\gamma_q, \gamma_q)) = T(\beta_i, \gamma_q) \geq 0.$$

270 The rest of values are obtained from Lemma 4.1.

Now, let us consider a binary operator  $T$  expressed by formula (7). Monotonicity, commutativity and the fact that the element 1 is the neutral element are straightforward by definition of  $T$  taking into account that  $T_1$  and  $T_2$  are t-norms on  $C_\beta$  and  $C_\gamma$ . Let us check that  $T$  is associative. Take  $x, y, z \in L \setminus \{0, 1\}$  (whenever one of them is equal to 0 or 1, associativity is trivial). If  $x, y, z \in C_\beta$  or  $x, y, z \in C_\gamma$ , then  $T(x, T(y, z)) = T(T(x, y), z)$  because  $T_1$  and  $T_2$  are t-norms on  $C_\beta$  and  $C_\gamma$  respectively. Otherwise, by definition of  $T$ , we have that  $T(x, T(y, z)) = 0 = T(T(x, y), z)$ . Therefore,  $T$  is a t-norm on  $L$ . In addition,  $T(\beta_1, \beta_1) = T_1(\beta_1, \beta_1) = 0$ ,  $T(\gamma_q, \gamma_q) = T_2(\gamma_q, \gamma_q) = \gamma_q$ , and  $T(\beta_1, \gamma_q) = 0$ .  $\square$

280 After studying each case, we propose a theorem that compiles the previous results.

**Theorem 4.8.** *If  $T$  is a t-norm on  $L$ , then  $T$  is expressed by formula (1), (2), (3), (4), (5), (6) or (7).*

*Proof.* We have that  $T(\beta_1, \beta_1) \leq \beta_1$ , that is, two possible values.

- 285 1. If  $T(\beta_1, \beta_1) = \beta_1$ , by monotonicity  $\beta_1 \leq T(\gamma_q, \gamma_q) \leq \gamma_q$ . Hence,  $T(\gamma_q, \gamma_q) \in \{\beta_1, \gamma_q\}$ . This implies that  $T$  is expressed by formula (1) or (2) using Proposition 4.2 and 4.3 respectively.
2. If  $T(\beta_1, \beta_1) = 0$ , we consider several cases: If  $T(\gamma_q, \gamma_q) = \beta_1$ , by Proposition 4.4,  $T$  is expressed by formula (3). If  $T(\gamma_q, \gamma_q) \in C_\gamma \setminus \{\gamma_q\}$ , by Proposition 4.5,  $T$  is expressed by formula (4) or (5). If  $T(\gamma_q, \gamma_q) = \gamma_q$ , we must take into account the two possible values of  $T(\beta_1, \gamma_q)$ , that is,  $T(\beta_1, \gamma_q) \in \{0, \beta_1\}$ . By Proposition 4.6 and 4.7,  $T$  is expressed by formula (6) or (7), respectively.

$\square$

4  
5  
6  
7  
8  
9 295 **5. Archimedean t-norms**

10  
11 In this section, we enunciate the results that involve the Archimedean t-  
12 norms on  $L$ .  
13

14 Let us consider the following notation (it can be found in [24]). Given a  
15 bounded lattice  $L$ , a t-norm  $T$  and  $x \in L$ , the term  $x_T^{(n)}$  denotes the following  
16  
17

$$x_T^{(1)} = x \text{ and } x_T^{(n)} = T(x_T^{(n-1)}, x) \text{ for } n \geq 2.$$

18  
19  
20 **Definition 5.1** ([36]). *Let  $L$  be a bounded lattice and  $T : L \times L \rightarrow L$  a t-norm  
21 on  $L$ . The t-norm  $T$  is called Archimedean if for each  $x, y \in L \setminus \{0, 1\}$  there is  
22  
23  
24 300  $n \in \mathbb{N}$  such that  $x_T^{(n)} < y$ .*

25 We will use the following characterization for Archimedean t-norms on finite  
26 lattices.  
27  
28

29 **Proposition 5.2** ([5]). *Let  $L$  be a finite lattice and  $T : L \times L \rightarrow L$  a t-norm.  
30 The following facts are equivalent.  
31  
32*

- 33  
34 305 (1)  *$T$  is an Archimedean t-norm.*  
35  
36 (2)  *$T$  has only two idempotents: 0 and 1.*

37 In [26], Medina defined subidempotence when the t-norm satisfies condition  
38 (2). His aim was to characterize the ordinal sum of t-norms. Subidempotence  
39 plays a significant role in his results. Under the hypotheses of Proposition 5.2,  
40  
41  
42  
43 310 the set of subidempotent t-norms and the set of Archimedean t-norms are equal.

44 In Table 4, we present the Archimedean t-norms on a discrete chain satisfying  
45 the same condition of Table 3.  
46

47 The condition  $T'_n(\alpha_n, \alpha_n) \leq \alpha_n$  is redundant. In addition, Archimedean  
48 property implies that  $T'_n(\alpha_1, \alpha_n) = 0$  as the following result shows. Therefore,  
49  
50  
51 315 the diagonal of Table 4 provides the number of Archimedean t-norms on a  
52 discrete chain with  $n + 2$  elements.  
53

54 **Proposition 5.3.** *If  $T$  is an Archimedean t-norm on a chain*

$$C = \{0 < \alpha_1 < \alpha_2 < \dots < \alpha_n < 1\},$$

7							2670	17387	127559
8								17387	131753
9									131753

Table 4: For each  $k$  and  $n$ , the number of Archimedean t-norms  $T'_k$  on a discrete chain with  $n + 2$  elements satisfying that  $T'_k(\alpha_1, \alpha_n) = 0$  and  $T'_k(\alpha_n, \alpha_n) \leq \alpha_k$ .

then  $T(\alpha_1, \alpha_n) = 0$ .

*Proof.* By contradiction, let us suppose that  $T(\alpha_1, \alpha_n) = \alpha_1$ . We have that

$$\alpha_1 = T(\alpha_1, \alpha_n) = T(T(\alpha_1, \alpha_n), \alpha_n) = T(\alpha_1, T(\alpha_n, \alpha_n)) \leq T(\alpha_1, \alpha_{n-1}) \leq \alpha_1$$

Hence  $T(\alpha_1, \alpha_{n-1}) = \alpha_1$ , again

$$\alpha_1 = T(\alpha_1, \alpha_{n-1}) = T(T(\alpha_1, \alpha_{n-1}), \alpha_{n-1}) = T(\alpha_1, T(\alpha_{n-1}, \alpha_{n-1})) \leq T(\alpha_1, \alpha_{n-2}) \leq \alpha_1$$

Recursively, in a finite number of steps, we obtain that  $T(\alpha_1, \alpha_1) = \alpha_1$ , that is, a contradiction. □

320 Now, we present all Archimedean t-norms on the lattice  $L$  (see Figure 1).

**Corollary 5.4.** *If  $T$  is an Archimedean t-norm on  $L$ , we have three possible cases:*

1  
2  
3  
4  
5  
6  
7  
8  
9 1. There is  $k \in \{1, 2, 3, \dots, p\}$  such that

$$10 \quad T(x, y) = \begin{cases} T_k(x, y) & \text{if } x, y \in C_\beta, \\ x \wedge y & \text{if } x = 1 \text{ or } y = 1, \\ \beta_1 & \text{if } (x, y) \in \{(\beta_i, \gamma_q), (\gamma_q, \beta_i) \mid i > k\}, \\ \beta_1 & \text{if } x = y = \gamma_q, \\ 0 & \text{otherwise.} \end{cases} \quad (8)$$

11  
12  
13  
14  
15  
16  
17  
18 where  $T_k$  is an Archimedean  $t$ -norm on  $C_\beta$  satisfying  $T_k(\beta_p, \beta_p) \leq \beta_k$ , and  
19  $T'$  is an Archimedean  $t$ -norm on  $C_\gamma$ .

20  
21  
22 2.

$$23 \quad T(x, y) = \begin{cases} T_1(x, y) & \text{if } x, y \in C_\beta, \\ T_2(x, y) & \text{if } x, y \in C_\gamma, \\ 0 & \text{otherwise.} \end{cases} \quad (9)$$

24  
25  
26  
27  
28 where  $T_1$  is an Archimedean  $t$ -norm on  $C_\beta$  and  $T_2$  is an Archimedean  
29  $t$ -norm on  $C_\gamma$ .

30  
31 3. There is  $k \in \{2, 3, \dots, p\}$  such that

$$32 \quad T(x, y) = \begin{cases} T_1(x, y) & \text{if } x, y \in C_\beta, \\ T_2(x, y) & \text{if } x, y \in C_\gamma, \\ \beta_1 & \text{if } (x, y) \in \{(\beta_i, \gamma_q), (\gamma_q, \beta_i) \mid i \geq k\}, \\ 0 & \text{otherwise.} \end{cases} \quad (10)$$

33  
34  
35  
36  
37  
38  
39 where  $T_1$  is an Archimedean  $t$ -norm on  $C_\beta$  satisfying that  $T_1(\beta_p, \beta_p) < \beta_k$ ,  
40 and  $T_2$  is an Archimedean  $t$ -norm on  $C_\gamma$ .

41  
42  
43 *Proof.* It is a consequence of Theorem 4.8, Proposition 5.2, and Proposition

44  
45 5.3. □

## 46 47 48 6. Divisible $t$ -norms

49  
50 In this section we focus on the divisible  $t$ -norms defined on the lattice of  
51 Figure 1. We study each  $t$ -norm presented in Section 4 and determine when  
52 they are divisible  $t$ -norms. It is important to point out that, sometimes, the  
53 existence of divisible  $t$ -norms depends on the values of  $p$  and  $q$ . Let us start  
54  
55 335 recalling the notion.

**Definition 6.1** ([20]). *Let  $L$  be a bounded lattice and  $T : L \times L \rightarrow L$  a  $t$ -norm on  $L$ . The  $t$ -norm  $T$  is called divisible if for all  $x, y \in L$  satisfying  $x \leq y$ , there is  $z \in L$  such that  $T(y, z) = x$ .*

When the lattice is a discrete chain, a  $t$ -norm is 1-Lipschitz if and only if it is divisible (see [12]).

Under the premise that the lattice is a discrete chain, their divisible  $t$ -norms (or 1-Lipschitz  $t$ -norms) are completely described in [25]. The following result will help us to know the number of them.

**Lemma 6.2** ([25]). *Let  $C$  be the chain  $\{0, \alpha_1, \alpha_2, \dots, \alpha_n, 1\}$ . Then there is a bijection between the set of all divisible  $t$ -norms on  $C$  and the power set  $\mathcal{P}(C \setminus \{0, 1\})$ . Thus there are  $2^n$  divisible  $t$ -norms on  $C$ .*

In fact, a divisible  $t$ -norm on a discrete chain is determined by its non trivial idempotent elements.

**Remark 6.3.** *The only divisible and Archimedean  $t$ -norm on a discrete chain  $C = \{0, \alpha_1, \alpha_2, \dots, \alpha_n, 1\}$  is the Lukasiewicz  $t$ -norm  $T_L$  (see [25]), whose values  $T_L(\alpha_i, \alpha_j)$  are the following*

$$T_L(\alpha_i, \alpha_j) = \begin{cases} \alpha_{i+j-n-1} & \text{if } i + j - n - 1 > 0, \\ 0 & \text{otherwise.} \end{cases}$$

Now, we present two lemmas which will be used in some propositions.

**Lemma 6.4.** *If  $T$  is a divisible  $t$ -norm on  $L$  and  $\omega \in L$  is an idempotent element of  $T$ , we have that*

1. *If  $x \leq \omega$ ,  $T(\omega, x) = x$ .*
2. *If  $\omega \leq x$ ,  $T(\omega, x) = \omega$ .*

*Proof.* If  $x \leq \omega$ , by divisibility, there is  $z \in L$  such that  $T(\omega, z) = x$ . By associativity,

$$T(\omega, x) = T(\omega, T(\omega, z)) = T(T(\omega, \omega), z) = T(\omega, z) = x.$$

The second case is clear using the monotonicity of  $T$ . □

**Lemma 6.5.** *If  $T$  is a divisible t-norm on  $L$  and  $T(\gamma_q, \gamma_q) \in C_\gamma$ , then  $T|_{C_\gamma^2}$  is a divisible t-norm on  $C_\gamma$ .*

*Proof.* The restriction is well-defined because  $T(\gamma_q, \gamma_q) \in C_\gamma$ . Take  $x, y \in C_\gamma$  satisfying  $x \leq y$ . If  $x = 0$  or  $x = 1$ , divisibility is clear. Otherwise,  $x = \gamma_j$  for some  $j \in \{1, 2, \dots, q\}$ . Since  $T$  is a divisible t-norm, there is  $z \in L$  such that  $T(y, z) = x$ . This implies that  $\gamma_j \leq z$ , hence  $z \in C_\gamma$ .  $\square$

Unlike the case of  $C_\gamma$ , if a t-norm  $T$  is divisible on  $L$ , it is not possible to ensure that the restriction on the chain  $C_\beta$  is also a divisible t-norm (due to the structure of the lattice). Therefore, each case must be analyzed independently. Below, based on formulas (1)-(7), we present the divisible t-norms on  $L$ .

**Proposition 6.6.** *If  $q \geq 2$ , there are no divisible t-norms on  $L$  satisfying formula (1).*

*Proof.* By contradiction, let us suppose that  $T$  is a divisible t-norm according to formula (1). Since  $\gamma_1 \leq \gamma_q$ , there is  $z \in L$  such that  $T(z, \gamma_q) = \gamma_1$ . However, by definition of  $T$ ,  $T(z, \gamma_q) \in \{0, \beta_1, \gamma_q\}$ , and  $q \geq 2$ .  $\square$

**Proposition 6.7.** *If  $q = 1$  and  $T$  is a divisible t-norm on  $L$  satisfying  $T(\beta_1, \beta_1) = \beta_1$  and  $T(\gamma_1, \gamma_1) = \beta_1$ , then  $T$  is expressed as follows:*

$$T(x, y) = \begin{cases} T'(x, y) & \text{if } x, y \in C_\beta, \\ x \wedge y & \text{if } x = 1 \text{ or } y = 1, \\ \beta_1 & \text{if } (x, y) \in \{(\beta_i, \gamma_1), (\gamma_1, \beta_i) \mid i \in \{1, \dots, p\}\}, \\ \beta_1 & \text{if } x = y = \gamma_1, \\ 0 & \text{otherwise.} \end{cases} \quad (11)$$

where  $T'$  is a divisible t-norm on  $C_\beta$  satisfying  $T'(\beta_1, \beta_1) = \beta_1$ .

*Proof.* Firstly, we prove that each divisible t-norm  $T$  on  $L$  satisfying  $T(\beta_1, \beta_1) = \beta_1$  and  $T(\gamma_1, \gamma_1) = \beta_1$  has this expression. Finally, we will prove that each binary operator  $T$  on  $L$  which has this expression is a divisible t-norm satisfying the mentioned conditions.

6  
7  
8  
9 If  $T$  is a divisible t-norm on  $L$ , by Proposition 4.2,  $T$  must be like formula  
10 (1). Let us prove that  $T' = T|_{C_\beta^2}$  is divisible. Take  $x, y \in C_\beta \setminus \{0, 1\}$  satisfying  
11  $x \leq y$ . If  $x = \beta_1$ , by monotonicity of  $T$ , taking  $z = \beta_1$  we have that  $\beta_1 =$   
12  $T(\beta_1, \beta_1) \leq T(y, z) \leq \beta_1$ . If  $x > \beta_1$ , since  $T$  is divisible, there is  $z \in L$  such that  
13  $T(\beta_1, \beta_1) \leq T(y, z) \leq \beta_1$ . If  $x > \beta_1$ , since  $T$  is divisible, there is  $z \in L$  such that  
14  $T(y, z) = x$ . This implies that  $x \leq z$ , hence  $x \in C_\beta$ . Therefore,  $T'$  is divisible.  
15  
16

17 Conversely, take the binary operator  $T$  of the formula. We know that  $T$  is  
18 a t-norm due to Proposition 4.2. Now, let us prove that  $T$  is divisible. Take  
19  $x, y \in L$  such that  $x \leq y$ . If  $x = \beta_1$ , put  $z = \beta_1$ . If  $x > \beta_1$ , divisibility of  $T'$   
20 provides an element  $z \in C_\beta \subseteq L$  such that  $T(z, y) = x$ . If  $x \notin C_\beta$ , then  $x = \gamma_1$ .  
21 Here, divisibility is trivial because  $y = x$  or  $y = 1$ .  $\square$   
22  
23  
24

25 **Proposition 6.8.** *Each divisible t-norm  $T$  on  $L$  satisfying  $T(\beta_1, \beta_1) = \beta_1$  and*  
26  *$T(\gamma_q, \gamma_q) = \gamma_q$  is expressed as follows:*  
27

$$28 \quad T(x, y) = \begin{cases} T_1(x, y) & \text{if } x, y \in C_\beta, \\ T_2(x, y) & \text{if } x, y \in C_\gamma, \\ \beta_1 & \text{if } (x, y) \in \{(\beta_i, \gamma_q), (\gamma_q, \beta_i) \mid i \in \{1, \dots, p\}\}, \\ 0 & \text{otherwise.} \end{cases} \quad (12)$$

29 where  $T_1$  is a divisible t-norm on  $C_\beta$  satisfying  $T_1(\beta_1, \beta_1) = \beta_1$  and  $T_2$  is a  
30 divisible t-norm on  $C_\gamma$  satisfying  $T_2(\gamma_q, \gamma_q) = \gamma_q$ .  
31  
32  
33  
34  
35

36 *Proof.* Firstly, we prove that each divisible t-norm  $T$  on  $L$  satisfying  $T(\beta_1, \beta_1) =$   
37  $\beta_1$  and  $T(\gamma_q, \gamma_q) = \gamma_q$  has this expression. Finally, we will prove that each binary  
38 operator  $T$  on  $L$  which has this expression is a divisible t-norm satisfying the  
39 mentioned conditions.  
40  
41  
42  
43  
44  
45

46 If  $T$  is a divisible t-norm on  $L$ , by Proposition 4.3,  $T$  must be like formula  
47 (2). By Lemma 6.5,  $T_2 = T|_{C_\gamma^2}$  is divisible on  $C_\gamma$ . Now, let us prove that  
48  $T_1 = T|_{C_\beta^2}$  is divisible. Take  $x, y \in C_\beta \setminus \{0, 1\}$ . If  $x = \beta_1$ , by monotonicity of  $T$ ,  
49 taking  $z = \beta_1$  we have that  $\beta_1 = T(\beta_1, \beta_1) \leq T(y, z) \leq \beta_1$ . If  $x > \beta_1$ , since  $T$  is  
50 divisible, there is  $z \in L$  such that  $T(y, z) = x$ . This implies that  $x \leq z$ , hence  
51  $x \in C_\beta$ . Therefore,  $T_1$  is divisible on  $C_\beta$ .  
52  
53  
54  
55

56 Conversely, take the binary operator  $T$  of the formula. We know that  $T$  is  
57  
58  
59  
60

62  
63  
64  
65

a t-norm due to Proposition 4.3. Now, let us prove that  $T$  is divisible. Take

400  $x, y \in L$  such that  $x \leq y$ , we enumerate all the possibilities:

1. If  $x, y \in C_\beta$ , there is  $z \in C_\beta$  such that  $T(z, y) = x$  because  $T_1$  is divisible on  $C_\beta$ .
2. If  $x \in C_\beta$  and  $y \in C_\gamma$ , necessarily  $x = \beta_1$  and  $y = \gamma_q$ . Putting  $z = \beta_1$  we have that  $T(y, z) = x$ .
- 405 3. If  $x \in C_\gamma$ , then  $y \in C_\gamma$ . Since  $T_2$  is divisible on  $C_\gamma$ , there is  $z \in C_\gamma$  such that  $T(z, y) = x$ .

□

**Proposition 6.9.** *If  $q \geq 2$ , there are no divisible t-norms on  $L$  satisfying formula (3).*

410 *Proof.* It is similar to Proposition 6.6. □

Now, we study formula (3) whenever  $q = 1$ . If  $p = 1$ ,  $L$  is a discrete chain and its divisible t-norms are well-known. The following result shows the case  $p \geq 2$ .

**Proposition 6.10.** *If  $q = 1$  and  $p \geq 2$ , each divisible t-norm  $T$  on  $L$  satisfying  $T(\beta_1, \beta_1) = 0$  and  $T(\gamma_1, \gamma_1) = \beta_1$  is expressed as:*

$$T(x, y) = \begin{cases} T_L(x, y) & \text{if } x, y \in C_\beta, \\ x \wedge y & \text{if } x = 1 \text{ or } y = 1, \\ \beta_1 & \text{if } x = y = \gamma_1, \\ 0 & \text{otherwise.} \end{cases} \quad (13)$$

or

$$T(x, y) = \begin{cases} T_L(x, y) & \text{if } x, y \in C_\beta, \\ x \wedge y & \text{if } x = 1 \text{ or } y = 1, \\ \beta_1 & \text{if } (x, y) \in \{(\beta_p, \gamma_1), (\gamma_1, \beta_p)\}, \\ \beta_1 & \text{if } x = y = \gamma_1, \\ 0 & \text{otherwise.} \end{cases} \quad (14)$$

where  $T_L$  is the Lukasiewicz t-norm (see Remark 6.3).

1  
2  
3  
4  
5  
6  
7  
8  
9  
415 *Proof.* Firstly, we prove that each divisible t-norm  $T$  on  $L$  satisfying  $T(\beta_1, \beta_1) =$   
10  $0$  and  $T(\gamma_1, \gamma_1) = \beta_1$  has one of these expressions. Finally, we will prove that  
11 each binary operator  $T$  on  $L$  which has one of these expressions, is a divisible  
12 t-norm satisfying the mentioned conditions.  
13  
14

15 By Proposition 4.4,  $T$  is expressed by formula (3) for some  $k \in \{1, 2, \dots, p\}$ .  
16 Let us check that  $k \leq p - 2$  is not possible under the hypothesis of divisibility.  
17 For each  $z \leq \beta_p$ , we have that  
18  
19

$$20 \quad T_k(z, \beta_p) \leq T_k(\beta_p, \beta_p) \leq \beta_{p-2} < \beta_{p-1}.$$

21 Hence, there is not  $z \in L$  such that  $T(z, \beta_p) = \beta_{p-1}$ , that is, divisibility fails.  
22  
23

24 Therefore,  $k \geq p - 1$ .  
25  
26

27 Now, taking into account that  $T$  is a divisible t-norm, let us study the two  
28 values of  $k$ :  
29

30 1. Case  $k = p$ . Take  $x, y \in C_\beta \setminus \{0, 1\}$  satisfying  $x \leq y$ . Since  $T$  is divisible,  
31 there is  $z \in L$  such that  $T(y, z) = x$ . If  $x > \beta_1$ , then  $z \in C_\beta$ . If  $x = \beta_1$ ,  
32 then  $z \in C_\beta \cup \{\gamma_1\}$ . But  $T(\gamma_1, y) = 0$  by definition of  $T$  whenever  $y = \beta_i$   
33 for each  $i$ . Hence,  $z \in C_\beta$  and  $T|_{C_\beta^2}$  is a divisible t-norm on  $C_\beta$ . According  
34 to Lemma 6.4 and the fact that  $T(\beta_1, \beta_p) = 0$ , we have that  $T|_{C_\beta^2}$  has no  
35 non-trivial idempotent elements. Therefore,  $T|_{C_\beta^2} = T_L$  (check Remark  
36 6.3), and formula (13) is obtained.  
37  
38

39 2. Case  $k = p - 1$ .  
40  
41

42 If  $p = 2$ , then  $T(\beta_2, \beta_2) \leq \beta_1$ . Divisibility provides  $z \in L$  such that  
43  $T(\beta_2, z) = \beta_1$ . Since  $T(\beta_1, \beta_2) = 0$ ,  $z = \beta_2$ . Therefore, the values of  $T|_{C_\beta^2}$   
44 are completely determined and it is equal to the Łukasiewicz t-norm  $T_L$ .  
45  
46

47 If  $p \geq 3$ , since  $T(\beta_1, \beta_p) = 0$  and  $T$  is divisible, Lemma 6.4 states that the  
48 elements  $\beta_1, \beta_2, \dots, \beta_p$  are not idempotents. Let us prove that  $T(\beta_i, \beta_j) <$   
49  $\beta_i \wedge \beta_j$  for each  $i, j \in \{1, 2, \dots, p\}$ . Without loss of generality, suppose  
50  $\beta_i \leq \beta_j$ . Take  
51  
52

$$53 \quad t = \min\{m \in \{1, 2, \dots, p\} \mid T(\beta_m, \beta_i) = \beta_i\}.$$

The set is non-empty and  $i < t \leq j$ . By associativity,

$$\beta_i = T(\beta_i, \beta_t) = T(T(\beta_i, \beta_t), \beta_t) = T(\beta_i, T(\beta_t, \beta_t))$$

this is a contradiction by definition of  $t$  and the fact that  $\beta_t$  is not idempotent. Hence, we can conclude that  $T(\beta_i, \beta_j) < \beta_i$ , equivalently,  $T(\beta_i, \beta_j) < \beta_i \wedge \beta_j$  for each  $i, j \in \{1, 2, \dots, p\}$ .

Given  $\beta_i \leq \beta_j$ , divisibility of  $T$  provides an element  $z \in L$  such that  $T(\beta_j, z) = \beta_i$ . By monotonicity of  $T$  and the values of  $T(\beta_j, \gamma_1)$ , notice that we can guarantee that  $z \in C_\beta$  for each case, except for  $i = 1$  and  $j = p$  simultaneously. In that case, let us check that  $T(\beta_p, \beta_2) = \beta_1$ . We list the following steps:

- (a)  $T(\beta_p, \beta_i) = \beta_{i-1}$  for  $i > 2$ : Since  $\beta_{i-1} \leq \beta_p$  and  $i - 1 \neq 1$ , there is  $z \in C_\beta$  such that  $T(\beta_p, z) = \beta_{i-1}$ . For  $i = p$ , we have that  $z \geq \beta_{p-1}$ , that is,  $T(\beta_p, z) = \beta_{p-1}$ . Using that  $T(\beta_p, z) < \beta_p \wedge z$ , we have that  $z > \beta_{p-1}$ , that is,  $z = \beta_p$ . Hence,  $T(\beta_p, \beta_p) = \beta_{p-1}$ . The rest of values are obtained recursively. Taking into account that  $T(\beta_p, \beta_1) = 0$ ,  $T(\beta_p, \beta_i)$  is completely determined except for  $i = 2$ .
- (b)  $T(\beta_{p-1}, \beta_3) = \beta_1$ : A process similar to the previous one provides that  $T(\beta_{p-1}, \beta_i) = \beta_{i-2}$ . In particular, for  $i = 3$  we have  $T(\beta_{p-1}, \beta_3) = \beta_1$ . Notice that  $i = 3$  can be considered because  $p \geq 3$ .
- (c)  $T(\beta_p, \beta_2) = \beta_1$ : We know that  $T(\beta_p, \beta_2) < \beta_p \wedge \beta_2 = \beta_2$ . If  $T(\beta_p, \beta_2) = 0$ , then

$$0 = T(\beta_p, \beta_2) = T(\beta_p, T(\beta_p, \beta_3)) = T(T(\beta_p, \beta_p), \beta_3) = T(\beta_{p-1}, \beta_3) = \beta_1.$$

A contradiction, hence  $T(\beta_p, \beta_2) = \beta_1$ . This implies that  $T|_{C_\beta^2}$  is a divisible t-norm on the discrete chain  $C_\beta$ . Since  $T|_{C_\beta^2}$  has no non-trivial idempotents,  $T|_{C_\beta^2} = T_L$  (check Remark 6.3), and formula (14) is obtained.

Conversely, if  $T$  is expressed by formula (13) or formula (14), it is easy to prove that each case is a divisible t-norm, bearing in mind that  $T_L$  is a divisible t-norm.  $\square$

**Proposition 6.11.** *Each divisible t-norm  $T$  on  $L$  satisfying  $T(\beta_1, \beta_1) = 0$  and  $T(\gamma_q, \gamma_q) \in C_\gamma \setminus \{\gamma_q\}$  is expressed as follows: There is  $k \in \{2, 3, \dots, p\}$  such that*

$$T(x, y) = \begin{cases} T_1(x, y) & \text{if } x, y \in C_\beta, \\ T_2(x, y) & \text{if } x, y \in C_\gamma, \\ \beta_1 & \text{if } (x, y) \in \{(\beta_i, \gamma_q), (\gamma_q, \beta_i) \mid i \geq k\}, \\ 0 & \text{otherwise.} \end{cases} \quad (15)$$

where  $T_2$  is a divisible t-norm on  $C_\gamma$  satisfying  $T_2(\gamma_q, \gamma_q) < \gamma_q$  and  $T_1$  is a t-norm on  $C_\beta$  satisfying that

1.  $T_1(\beta_i, \beta_1) = 0$  for  $i < k$ .
2. If  $T_1(\beta_k, \beta_k) = \beta_k$ , then

$$T_1(\beta_1, \beta_p) = T_1(\beta_1, \beta_k) = \beta_1.$$

3. If  $T_1(\beta_k, \beta_k) < \beta_k$ , then

$$T_1(\beta_1, \beta_p) = T_1(\beta_1, \beta_k) = 0.$$

and

$$T(\beta_p, \beta_p) \leq \beta_{k-1}.$$

4. For  $\beta_i \leq \beta_j$ , with  $i \geq 2$ , there is  $z \in C_\beta$  such that  $T_1(\beta_j, z) = \beta_i$ .
5. For  $\beta_1 \leq \beta_i$ , with  $i < k$ , there is  $z \in C_\beta$  such that  $T_1(\beta_i, z) = \beta_1$ .

*Proof.* Firstly, we prove that each divisible t-norm  $T$  on  $L$  satisfying  $T(\beta_1, \beta_1) = 0$  and  $T(\gamma_q, \gamma_q) \in C_\gamma \setminus \{\gamma_q\}$  has this expression. Finally, we will prove that each binary operator  $T$  on  $L$  which has this expression, is a divisible t-norm satisfying the mentioned conditions.

By Proposition 4.5,  $T$  is expressed as formula (4) or there is  $k \in \{2, \dots, p\}$  such that  $T$  is expressed as (5). Let us check that the first one is not a divisible t-norm: We have that  $\beta_1 \leq \gamma_q$ , but  $T(\gamma_q, x) \neq \beta_1$  for all  $x \in L$ . Therefore,  $T$  must be expressed as the second formula. Therefore, let us prove that  $T_2$  is divisible and the items 4 and 5 of  $T_1$ .

1  
2  
3  
4  
5  
6  
7  
8  
9 -  $T_2$  is divisible: Take  $x, y \in C_\gamma$  satisfying  $x \leq y$ . Since  $T$  is divisible, there  
10  $z \in L$  such that  $T(y, z) = x$ . Then,  $x \leq z$ . Taking into account the configuration  
11 of  $L$ ,  $z \in C_\gamma$ .  
12

13  
14 475 - Item 4: Take  $\beta_i \leq \beta_j$ , with  $i \geq 2$ . Since  $T$  is divisible, there is  $z \in L$  such  
15 that  $T_1(\beta_j, z) = \beta_i$ . Then,  $\beta_i \leq z$ . Taking into account that  $i \geq 2$  and the  
16 configuration of  $L$ ,  $z \in C_\beta$ .  
17

18 - Item 5:  $\beta_1 \leq \beta_i$ , with  $i < k$ . Since  $T$  is divisible, there is  $z \in L$  such that  
19  $T_1(\beta_i, z) = \beta_1$ . Then,  $\beta_1 \leq z$ . This implies that  $z \in C_\beta$  or  $z = \gamma_q$ . However,  
20  $z = \gamma_q$  is not possible because  $T(\gamma_q, \beta_i) = 0$  whenever  $i < k$ .  
21 480  
22

23 We conclude that  $T$  is expressed by formula (15).  
24

25 Conversely, if a binary operator  $T$  is expressed by formula (15), then  $T$  is  
26 a t-norm because it is a particular case of formula (5). Let us prove that  $T$  is  
27 divisible. Take  $x, y \in L$  such that  $x \leq y$ .  
28  
29

- 30 485 1. If  $x \in C_\gamma$ , then  $y \in C_\gamma$ . By divisibility of  $T_2$  on  $C_\gamma$ , there is  $z \in C_\gamma$  such  
31 that  $T(y, z) = x$ .  
32  
33 2. If  $x \in C_\beta \setminus \{\beta_1\}$ , then  $y \in C_\beta$ . By item 4, there is  $z \in C_\beta$  such that  
34  $T(y, z) = x$ .  
35  
36 3. If  $x = \beta_1$  and  $y = \beta_i$  with  $i < k$ , then by item 5, there is  $z \in C_\beta$  such that  
37  $T(y, z) = x$ .  
38 490  
39 4. If  $x = \beta_1$  and  $y = \beta_i$  with  $i \geq k$ , then  $T(y, \gamma_q) = x$ .  
40  
41 5. If  $x = \beta_1$  and  $y = \gamma_q$ , then  $T(y, \beta_k) = x$ .  
42  
43

44 Hence  $T$  is a divisible t-norm on  $L$  satisfying required conditions.  $\square$   
45

46 **Proposition 6.12.** *If  $p \leq 2$ , each divisible t-norm  $T$  on  $L$  satisfying  $T(\beta_1, \beta_1) =$   
47  $0$ ,  $T(\gamma_q, \gamma_q) = \gamma_q$ , and  $T(\beta_1, \gamma_q) = \beta_1$  is expressed as follows:*  
48

$$49 \quad T(x, y) = \begin{cases} T'(x, y) & \text{if } x, y \in C_\gamma, \\ x \wedge y & \text{if } x = 1 \text{ or } y = 1, \\ \beta_1 & \text{if } (x, y) \in \{(\beta_i, \gamma_q), (\gamma_q, \beta_i) \mid i \geq 1\}, \\ 0 & \text{otherwise.} \end{cases} \quad (16)$$

495 *Proof.* Firstly, we prove that each divisible t-norm  $T$  on  $L$  satisfying  $T(\beta_1, \beta_1) = 0$ ,  $T(\gamma_q, \gamma_q) = \gamma_q$ , and  $T(\beta_1, \gamma_q) = \beta_1$  has this expression. Finally, we will prove that each binary operator  $T$  on  $L$  which has this expression, is a divisible t-norm satisfying the mentioned conditions.

By Proposition 4.6,  $T$  is expressed by formula (6). By Lemma 6.5,  $T' = T|_{C_\gamma^2}$  is a divisible t-norm on  $C_\gamma$ . Moreover,  $T'(\gamma_q, \gamma_q) = T(\gamma_q, \gamma_q) = \gamma_q$ .

Conversely, take a binary operator  $T$  from formula (16). We know that  $T$  is a t-norm because it is a particular case of formula (6). Finally, let us prove that  $T$  is divisible, taking  $x, y \in L$  such that  $x \leq y$ .

1. If  $x \in C_\gamma$ , then  $y \in C_\gamma$ . Since  $T'$  is divisible on  $C_\gamma$ , there is  $z \in C_\gamma$  such that  $T(y, z) = x$ .
2. If  $x = \beta_1$ , then  $y \in \{\beta_1, \beta_p\}$  (we admit  $p = 1$ ). We have that  $T(\gamma_q, \beta_i) = \beta_1$  for each  $i = 1, 2$ .
3. If  $x = \beta_2$  (only in the case  $p = 2$ ), then  $y = \beta_2$  or  $y = 1$ . Putting  $z = 1$  and  $z = \beta_2$  in each case respectively to obtain  $T(y, z) = x$ .

510 Therefore,  $T$  is a divisible t-norm on  $L$  satisfying  $T(\gamma_q, \gamma_q) = T'(\gamma_q, \gamma_q) = \gamma_q$ . □

**Proposition 6.13.** *If  $p \geq 3$ , there are no divisible t-norms on  $L$  satisfying formula (6).*

*Proof.* By contradiction, let us suppose that  $T$  satisfies formula (6) and it is a divisible t-norm. Since  $\beta_2 \leq \beta_3$ , then there is  $z \in L$  such that  $T(\beta_3, z) = \beta_2$ . This implies that  $z \geq \beta_2$ , hence  $\beta_2 \leq z \leq \beta_p$  ( $z = 1$  is trivially impossible). However,  $T(\beta_2, \beta_i) = 0$  for each  $1 \leq i \leq p$ . □

**Proposition 6.14.** *There are no divisible t-norms on  $L$  satisfying formula (7).*

*Proof.* If  $T$  is a divisible t-norm on  $L$  satisfying formula (7), then there is  $z \in L$  such that  $T(z, \gamma_q) = \beta_1$ . However, by definition of  $T$ , that is not possible. □

9 **7. Results about t-conorms**

10  
11 We recall that given a finite lattice  $(L, \leq_L)$ , the dual lattice  $(L', \leq_{L'})$  is  
12 formed by the same elements and  
13

$$14 \quad x \leq_{L'} y \iff y \leq_L x.$$

15  
16  
17 Therefore,  $0_L = 1_{L'}$  and  $1_L = 0_{L'}$ .

18  
19 Discrete chains are self-dual lattices. Lattices of the family of Figure 1 are  
20 self-dual if and only if  $p = q$ . However, their dual lattices belong to the same  
21 class, so we may apply the results interchanging the roles of  $p$  and  $q$ .  
22  
23

24 Given a t-norm  $T$  on a lattice, the following result provides a method to build  
25 a t-conorm  $S$  defined on the dual lattice. Of course, an analogous induction from  
26 t-conorms to t-norms on the dual lattice can be obtained.  
27  
28

29 **Proposition 7.1.** *Let  $(L, \leq_L)$  a finite lattice. If  $T : L \times L \rightarrow L$  is a t-norm,*  
30 *then  $S : L' \times L' \rightarrow L'$  defined by  $S(x, y) = T(x, y)$  is a t-conorm on the dual*  
31 *lattice  $(L', \leq_{L'})$ .*  
32  
33

34  
35 *Proof.* Clearly,  $S$  is well-defined because  $L'$  and  $L$  have the same elements.  
36

39  
40  
41  
42
1.  $S(x, y) = T(x, y) = T(y, x) = S(y, x)$  for each  $x, y \in L'$ .
  2.  $S(x, 0_{L'}) = T(x, 0_{L'}) = T(x, 1_L) = x$  for each  $x \in L'$ .
  3. Suppose that  $x \leq_{L'} y$ . Equivalently,  $y \leq_L x$ . We have that

$$43 \quad S(x, z) = T(x, z) \geq_L T(y, z) = S(y, z)$$

535 that is,  $S(x, z) \leq_{L'} S(y, z)$ .

4.  $S(x, S(y, z)) = T(x, T(y, z)) = T(T(x, y), z) = S(S(x, y), z)$  for each  
 $x, y, z \in L'$ .

□

53 Due to this proposition, we can transfer the results described for t-norms  
54 in the previous sections to t-conorms taking into account that the dual of each  
55 lattice is other lattice of the same family. For instance, if  $p = 5$  and  $q = 11$ ,

its dual is the lattice that takes  $p = 11$  and  $q = 5$ . Hence, we have provided a complete description of t-conorms defined on the lattices described in Figure 1. Similarly, for Archimedean and divisible t-conorms.

## 545 **Conclusion**

We have provided a complete classification and description of the t-norms defined on a family of lattices in terms of t-norms on discrete chains. Complementarily, the number of t-norms required on discrete chains is obtained by computational methods. We have done the same for Archimedean and divisible  
550 t-norms. They extend the results given by other authors in discrete chains (see [12, 25]). The last part has highlighted that each result can be transferred to t-conorms. We hope that similar arguments could be applied to some more general lattices, too.

## **Acknowledgements**

555 I wish to acknowledge Mirko Navara for his feedback and suggestions that have helped to present the results. Also, I am grateful to the anonymous referees for their comments, which led to several improvements on the originally submitted version of this paper, including an important correction for Proposition 4.5. This research has been supported by the Ministry of Education of the  
560 Czech Republic under Project GACR 19-09967S.
